Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFAL. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymuclectide sequence represents a human oligonuclectide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibiting the expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating

```
Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition alsociated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits.
                                                                                                                                                                                                              Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFRL; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                               TNFR1 expression modulation related antisense oligo SEQ ID No 53.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TWFR1), where the antisense compound inhibities expression of TWFR1. The antisense compound is useful for inhibiting the expression of TWFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TWFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TWFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                            The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as acacer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMFRI), where the antisense compound inhibits expression of TMFRI. The antisense compound is useful for inhibiting the expression of TMFRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TMFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TMFRI. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the TMFRI of the invention

0; diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polyniclectide sequence represents a human oligonuclectide relating to the TNFR1 of the invention The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRI), where the antisense compound inhibits expression of TNRI. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNRI. e.g. a liver disease (such as hepatitis, or injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRRI. The antisense compound is useful for Gaps ô 0.8%; Score 18; DB 1; Length 18; 100.0%; Pred. Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TWER1), where the antisense compound inhibits expression of TWER1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TWER1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as cancer, by inhibiting the expression of TWER1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating to the TWER1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMFRI), where the antisense compound inhibits expression of TMFRI. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TMFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonuclectide relating to the TMFRI of the invention
                                                                                                                                              Antisense compound, tumour necrosis factor receptor 1, liver disease; INFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; human; ds.

length targeted to mucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
          tumor
Novel antisense compound targeted to nucleic acid molecule encoding tumor
necrosis factor receptor 1 (TNFR1), useful for treating humans having
disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                            The invention relates to an antisense compound 8 to 30 nucleotides in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Example 18; Page 56; 121pp; English.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (INFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of

ó Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer. TUFRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TUFRI, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TUFRI. The antisense compound is useful for diagnostics, herapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TUFRI of the invention Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; Gaps TNFR1 expression modulation related antisense oligo SEQ ID No 134. ., Length 18; 0; Indels Sequence 18 BP; 9 A; 2 C; 6 G; 1 T; 0 U; 0 Other; DB 1; 20; Mismatches Dean NM; Score 18; Pred. The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRR1), where the antisense compound inhibiting the expression of TNRR1. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TNRR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disease (such as hepatitis, or liver injury) or a hyperproliferative disease compound is useful for dismostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNRR1 of the invention DB 1; Length 18; 20; Sequence 18 BP; 4 A; 5 C; 5 G; 4 T; 0 U; 0 Other; Score 18; Pred. It includes the complement of the p55 Ile-159 codon. PCR was used to amplify amino acids 3-159 or 2-159 of the p55 extracellular domain. The invention provides claimed methods of treating an myelodysplastic syndrome using an anti-TNF antibody or a chimeric antibody comprising variable regions (see ABP54870-71) from murine antibody comprising variable regions (see ABP54870-71) from murine antipeptides and antibodies of the invention can be used in the treatment of TNF-related pathologies such as acute and chronic immune and autoimmune pathologies, inflammatory diseases, neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Treating myelodysplastic syndrome in human, involves administering tumor necrosis factor-inhibiting amount of an anti-TNF antibody, monoclonal antibody GA2 or anti-TNF chimeric antibody.

The sequences given in AAI72611-19 are primers which were used in the production of a p55 fusion protein. The fusion protein closely mimics the production of a materially rearranged immunoglobulin (19 genes. The fusion proteins may be used in a chimeric antibody for treating psoriasis in humans. Psoriasis may be treated by administering: (a) anti-tumour necrosis factor (TNF) chimeric antibody (Ab) which competitively inhibits binding of TNF to monoclonal chimeric Ab cA2; or (b) anti-TNF chimeric Ab chack; or (c) anti-TNF chimeric Ab case or a man a non-human variable region, which binds to an epitope included in amino acids 87 - 108 or both 59 - 80 and 87 - 108 of a TNF sequence. The cA2 antibody has potent TNP-inhibiting and/or neutralizing activity. Levels of CA2 as low exhibited greater TNF-inhibiting activity and/or neutralizing activity and/or neutralizing activity the cA2 exhibited greater TNF-inhibiting activity and/or neutralizing activity than did the parent murine A2 monoclonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Treating psoriasis in humans comprises administering anti-tumor necrosisector (TNF) chimeric antibody CA2, or anti-TNF chimeric antibody which competitively inhibits binding of TNF to the antibody CA2.
                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; tumour necrosis factor; TNF; chimeric; antibody; cA2; primer; psoriasis; immunoglobulin; G1; amplify; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Siegel

TTGTGCCTACCCCAGATT

```
The invention relates to an isolated nucleic acid molecule that encodes a tumour necrosis factor-alpha (TNF-alpha) specific antibody. The nucleic acid molecule is useful in diagnosing and/or treating TNF-alpha-mediated pathologies and conditions, such as bacterial, viral or parasitic infections, chronic inflammatory diseases (e.g. rhemmatoid arthritis, Crohn's disease or ulcerative colitis), autoimmune diseases (e.g. systemic lupus erythematosus, diabetes mellitus or Grave's disease),
                                                                                                                                                                                                                                                                                        Human; TNF-alpha; tumour necrosis factor-alpha; gene therapy; malignancy; TNF-alpha-mediated pathology; bacterial infection; viral infection; ds; parasitic infection; chronic inflammatory disease; rhemmatoid arthritis; systemic lupus erythematosus; Crohn; disease; ulcerative colitis; autoimmune disease; diabetes mellitus; Grave's disease; vascular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         malignancies, vascular diseases and/or neurodegenerative diseases (e.g. Alzheimer's disease) and in research purposes. The present sequence represents the human TNF-alpha receptor DNA construct oligonucleotide #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid molecule for diagnosing or treating tumor necrosis factor alpha-mediated diseases, e.g. infections, chronic inflammatory diseases, autoimmune diseases, cancer or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                           neurodegenerative disease; Alzheimer's disease; TNF-alpha receptor
                                                                                                                                                                                                                               Human TNF-alpha receptor DNA construct oligonucleotide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 18 BP; 6 A; 3 C; 6 G; 3 T; 0 U; 0 Other;

monoclonal antibody cA2.

The invention describes a method of treating bacterial infection in a human comprising administering to the human a tumour necrosis factor (TNF) inhibiting amount of an anti-TNF chimeric antibody, which competitively inhibits binding of TNF to monoclonal antibody cA2. The methods are useful for treating bacterial infections, a pathology associated with a sepsis (e.g. endothelial damage, vascular damage, isseminated intravascular coagulation or severe hypotension). Shock resulting from bacterial infection, or inflammatory reaction resulting from bacterial infection, or inflammatory reaction resulting from bacterial infection. nsed treating TNF-related pathologies. This sequence represents a primer to isolate p55 extracellualr domain for use in the creation of a p55 variable region fusion construct heavy chain

antibody, and antigen-binding fragment, and manufacturing a polypeptide. The methods and compositions are also useful for the diagnosis and treatment of TWF-related pathologies, such as acute and chronic immune and autoimmune disorders (rheumatoid arthritis, thyroidosis, graft versus host disease, scleroderma, diabetes and Grave's disease), bacterial and viral infections including AIDS, inflammatory disease, is arroidosis, chronic inflammatory bowel disease, ulcerative colitis, Crohn's disease and atherosclerosis), neurodegenerative diseases (multiple sclerosis, Parkinson's disease, dementia and Alzheimer's disease), cancer, hepatitis, ocular neovascularisation, psoriasis, duodenal ulcers and angiogenesis of the female reproductive tract. The sequence presented is a PCR primer which was used to amplify the p55 extracellular domain

fragment, that selectively binds human tumour necrosis factor-alpha fragment, that selectively binds human tumour necrosis factor-alpha (TNPADPA). Comprising an antigen binding region of non-human origin and at least a portion of an antigon binding region. The antibody consists of a constant region heavy or light chain of human origin and an antigen binding region, comprising complementarity determining regions (CDRs) derived from an antibody of murine origin that binds to human TNP-alpha (Az or cAz), and a transwork region derived from a heavy or light chain of human origin. Also disclosed is an expression vector comprising a fragment, and the method for preparing it. The cytokine TNF causes proinflammatory actions which result in tissue injury, such as inducing procoagulant activity on vascular endothelial cells, increasing the release of platelet activating factor from macrophages, neutrophils and vascular endothelial cells. The methods are useful for preparing a humanised

The invention discloses a method for treating ankylosis, by administering a tumour necrosis factor (TWP)-inhibiting anti-TWP chimeric antibody at tumour necrosis factor (TWP)-inhibiting anti-TWP chimeric antibody at the antibody caption and binding of TWP to the murine monoclonal antibody a2, where the antibody comprises an immunoglobulin (Ig) G1 constant region and binds to an epitope of human TWP. The antibody consists of a constant region heavy or light chain of human origin and an antibody of murine origin that binds to human criming regions (CDRs) derived from an antibody of murine origin that binds to human TWP antibody of murine origin that binds to human TWP thain of human origin. The cytckine TWP causes pro-inflammatory actions which result in tissue injury, such as inducing procoagulant actions which result in tissue injury, such as inducing procoagulant actions which result in tissue injury, such as inducing procoagulant activity on vascular endothelial cells, increasing the adherence of neutrophils and lymphocytes and stimmlating the release of platelet cuttive treatment of antyposis and TWP-related pathologies, such as acute and treatment of antyphosis and TWP-related pathologies, such as acute and compositions manner of immune and autoimmune disorders (rheumatoid arthritis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          thyroidosis, graft versus host disease, scleroderma, diabetes and Grave's disease). Datterial and viral infections including AIDS, inflammatory diseases (sarcoidosis, chronic inflammatory bowel disease, ulcerative colitis, Crohn's disease and atherosclerosis), neurodegenerative diseases
                                                                                                     Treating ankylosis in a human, comprises administering a tumor necrosis factor (TNF) -inhibiting amount of anti-TNF chimeric antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        colitis, Crohn's disease and atherosclerosis), neurodegenerative disease (multiple sclerosis, Parkinson's disease, dementia and Alzheimer's disease), cancer, heparitis, ocular neovascularisation, psoriasis, duodenal ulcers and angiogenesis of the female reproductive tract. The chimeric anti-TNP Mab was well-tolerated and involved no haemodynamic, febrile or allergic episodes. The sequence presented is a PCR primer which was used to amplify the p55 extracellular domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; tumour necrosis factor alpha; TNF alpha; immunomodulator;

The invention describes a method of treating cachexia in a human comprising administering a tumour necrosis factor (TNF) inhibiting amount of: (a) an anti-TNF chimeric antibody, which competitively inhibits binding of TNF to monoclonal antibody (mAD) (AZ); (b) chimeric anti-TNF antibody (mAD) (AZ); (c) chimeric anti-TNF antibody cAZ; (c) at least one mAD cAZ, or its TNF-binding fragment; or (d) an anti-TNF chimeric antibody with epitopic specificity identical to mAD cAZ. Administering a TNF-inhibiting amount of an anti-TNF chimeric antibody which has epitopic specificity identical to mAD cAZ is useful cor treating cachexia in humans, particularly a cachexia associated with cancer, HIV or AIDS. This sequence repersents a primer used to isolate DNA encoding the human p55 extracellular domain for use in the creation
                                                                                                                                                                                                                                HIV or
                                                                                                                                                                                                                               with cancer, HIV (TNF)-inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

The method comprises administering an anti-TNF chimeric antibody which is specific for human TNFalpha. The method is useful for treating heart pathologies and rheumatoid arthritis. The present sequence represents a PCR primer used in the examples of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to a method of treating a tumour necrosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                 ó
                                                                                                                                                                                                                                                                The invention relates to a method of treating a vascular inflammatory pathology in a human, comprising administering a single or divided 0.5-15 mg/kg dose at least once every 1-6 weeks of an anti-tumour necrosis factor (TNP) chimeric antibody which competitively inhibits binding of TNF to monoclonal antibody cA2. The invention is used to treat a vascular inflammatory pathology particularly Kawasaki's pathology or disseminated intravascular coagulation or atherosclerosis. The present sequence represents a p55 extracellular domain PCR primer.
                                                                                                                                                                                     Treating a vascular inflammatory pathology, e.g. Kawasaki's pathology, comprises administering an anti-Tumor Necrosis Factor (TNF) chimeric antibody which competitively inhibits binding of TNF to a monoclonal

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                  The invention provides antisense compounds targeted to human tunmour necrosis factor receptor type 1 (TNFR1) RNA. These antisense compounds can be used in a method of inhibiting the expression of TNFR1 human cells or tissues. The antisense compounds specifically hybridize with one or more nucleic acids encoding TNFR1 modulating the function of nucleic acid molecules encoding TNFR1, ultimately modulating the amount of TNFR1 produced. The antisense compounds and method are useful as research reagents and diagnostics, and in the treatment and prophylaxis of infection, inflammation or tunmour formation. Sequences AAZ48482-565 represent antisense oligos used for inhibition of the human TNFR1 mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an antisense compound B to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of Treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
Antisense inhibition of tumor necrosis factor type 1 expression for diagnosis, treatment and prevention of disease, particularly tumores.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TNFR1 expression modulation related antisense oligo SEQ ID No 24.
                                                                                                                                                                                                                                                                                                                                                                                                                                      ..
                                                                                                                                                                                                                                                                                                                                                                                   ore 18; DB 1; Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This primer is used for the PCR amplification of the cytoplasmic domain of TNF-R1 from a plasmid pUC19-p55-TNF-R1 to produce a GST-TNF-R1 fusion protein. This is used in the production of GST fusion proteins for detecting and characterising a CAP in vitro. CD40 is a cell surface receptor involved in apoptosis. This system identifies CAP-1, a CD40 associated protein that specifically binds to CD40. Agonists and antagonists of CAP can increase or decrease the level of CAP expression in a cell and can thereby modulate the function of the cell. Such compounds can be used to treat cancer, autoimmune diseases like asthma, hay fever, rheumatoid arthritis and immunodeficically to CAP can be used to assay CAP, to detect pathologically altered levels. The CAP-1 encoding nucleic acid can be used to identify related genes and to express CAP for
diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New CD40 associated protein, agonists and antagonists - used to modulate cell proliferation, immune response, apoptosis etc., e.g. for treating

The invention relates to new oligonucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6. 11, 16, 18 or 33. The probes and primers ARV44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on
                                                        Detection of human papilloma virus DNA by amplification - using specific consensus primer pairs and pref. detection with generic or type specific probes for use in research and diagnosis.
                                                                                                                                                    The human papilloma virus (HPV) specific probes AAT10818-T10839 are used to detect, or type HPV for research or diagnostic purposes, e.g. to identify HPV that are implicated in genital or oral carcinomas. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid hybridisation probes - specific for selected human papilloma

and amplify fragments of the 11, B6, B7 and B1 regions of the HPV sequences. Detection of the amplification prods. is done with probes derived from consensus sequences found in all characterised HPV sequences. Probes AATA476-810 are examples of HPV typing probes for identifying the amplified products generated by 11 consensus primers. This sequence is a sense probe which has specificity for HPV11 and binds to the HPV genome at position 7058. (Updated on 25-MAR-2003 to correct PF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to new oligomucleotide probes and primers used for the detection of human papillomaviruses (HPV) which are not genital types 6, 11, 16, 18 or 33. The probes and primers AAT44608-T44693 are esp. used to detect HPV types 26, 31, 318, 35, 39, 40, 43, 45, 51-59 and 68. The primers can be used to detect these HPV types in conjunction with the consensus primers and typing probes AAT44733-T44906, which are based on and amplify fragments of the 11, E6, E7 and E1 regions of the HPV sequences. Detection of the amplification prods: is done with probes derived from consensus sequences found in all characterised HPV derived from consensus sequences found in all characterised HPV derived from consensus sequences found in all characterised HPV identifying the amplification prodes of HPV typing probes for identifying the amplification prodes by ill consensus primers. This sequence is a sense probe which has specificity for HPV11 and binds to the HPV genome at position 7059. (Updated on 25-MAR-2003 to correct PF

This sequence represents a human papillomavirus (HPV) L1 type-specific probe of the invention. This sequence may be used in conjuncture with L1 specific primers for detecting and typing HBV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

This sequence represents a human papillomavirus (HPV) L1 type-specific probe of the invention. This sequence may be used in conjuncture with L1 specific primers for detecting and typing HPV. Identification and typing of HPV is important as different types of HPV pose different risks for infected individuals. HPV16 and HPV18 have been more consistently identified in higher grades of cervical dysplasia and carcinoma than other HPV types. (Updated on 25-MRA-2003 to correct PR field.)

New fusion proteins resistant to proteclytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats.

Disclosure; Page 72; 120pp; English.

course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to provides a method for increasing the resistance of a core onto into the core protein a stabilising polypeptide of formula (Glya)X(Glyb)X(Glyc)Zln where Glya, Glyb, Glyc are 1-6 sequential Gly assidues and X, X, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a Sequences shown in AAV55812 to AAV55827 represent primers used in the

The invention relates to a novel chemically modified oligonucleotide having no more than about 27 nucleic acid base units. The oligonucleotide modulates mammalian telomere length. The chemically modified oligonucleotide of the invention may be useful for modulating the telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell or modulating the effects of aging of a mammalian cell. The oligonucleotides may also useful for treating diseases associated with abnormal telomere length such as aging and

          degradation by protesses and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in exyme/producy therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-AUG-2003 to correct OS field.)
 protein. The fusion proteins of the invention are more resistant to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New chemically modified oligonucleotides, useful for modulating telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell, or modulating the effects of aging of a mammalian cell.

                                                                                                       0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a host cell, made to express an insoluble or aggregated protein having free cysteines residues. The cell is then lysed by chemical, enzymatic or physical agents and solubilised by exposing it to a denaturing agent, a reducing agent and a cysteine blocking agent, and is refolded into a biologically active form by reducing the concentrations of denaturing and reducing agents. The protein may belong to the growth hormone supergene family or may be an anti-angiogenesis factor. The method is useful for preparing a refolded, soluble form of an insoluble or aggregated protein. The proteins of the invention can act as delivery vehicles for enhancement of the circulatory half-life of the therapeutics that are attached or for directing delivery of a specific carget within the body. Sequences ABK16774-ABK16852 represent PCR primers
hyperproliferative conditions including cancer. The current sequence is that of the G4 phosphorothioate oligonuclectide 2 (alternative) of the invention which was used to modulate telomere length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Making and refolding insoluble or aggregated proteins having free cysteaine by exposing host cell expressing protein to cysteine blocking agent, and exposing to cysteine reactive group to increase their effectiveness.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1 e.g. a liver disease (such as hepatitis, or liver injury) or a hyperpoliferative disorder such as cancer, by inhibiting this expression of TNRR1. The antisense compound is useful for diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a mouse oligonucleotide relating to the TNFR1 of the invention
                                                                                                                                                                                                Antisense compound; tumour necrosis factor receptor 1; liver disease; TNFR1; hepatitis; liver injury; hyperproliferative disorder; cancer; mouse; murine; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAQ61990-2001 are oligonucleotides which contain 64 or 63 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper- proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                  New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.

New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ61990-2001 are oligonucleotides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological discoders caused by phospholipase A2 activity in cases of hyper- proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such malignancy, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibition; replication; herpes simplex virus; HSV; HIV; human cytomegalovirus; influenza virus; inflammation; neurological disorders; phospholipase A2 activity; hyperproliferation; malignancy; cardiovascular disease; snake bite; malignancy; telomere length; retard; aging; ss.

                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                       New modified oligo-nucleotide contg guanine guartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibition, replication, herpes simplex virus, HSV, HIV, human cytomegalovirus, influenza virus, inflammation, neurological disorders, phospholipase A2 activity, hyperproliferation, mailgnancy, cardiovascular disease, snake bite, malignancy;

                                                                                                                                New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ61825-50 and AAQ61886-906 are oligonuclectides which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (ENSV). Oligonuclectides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide nucleic acid; PNA; HIV; human immunodeficiency virus; AIDS; antiviral; antisense; triple helix; ss.

                                                                                                                                                        contracting nucleons are provided which consists of naturally occurring nucleons covalently bound to a polyamide backbone and (b) hybridise to the translation initiation Aug region, 5 untranslated region (5 UTR), 3 untranslated region (1 UTR), splice innertions or coding sequence of a human immunodeficiency virus gene junctions or coding sequence of a human immunodeficiency virus gene chosen from env, gag, pol, rev and tat. The PNAs can be used to traget RNA and single stranded DNA (85DNA) to produce antisense-type gene regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first PNA strand binds with the first PNA strand binds with the result in a second PNA strand binds with the first or which facilitates cellular uptake. Further, since they contain amides of non-biological amino acids, the present sequence is a specifically claimed PNA sequence (represented by the sequence of mucleobases) targetting HIV genes. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·;

                                                                             The sequences given in AAQ73325-81 represent oligonucleotides which hybridise specifically with DNA or RNA from a herpes virus gene corresponding to one of the open reading frames UI5, -8, -9, -50, -27, 29, -30, -42, -52 or IE175 of herpes simplex virus type I (HSV-1). These oligos pref. hybridise with a translation initiation site, a coding region or a 5' untranslated region. These oligos may be used in compositions for the treatment and diagnosis of herpes viral infection, by contacting the virus or the animal, or its cells, tissues or body fluids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New modified oligo-nucleotide contg guanine guartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length

The sequences given in AAQ61990-2001 are oligonucleotides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length
inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   which contain a G4 or two G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25

The sequences given in AAQ61990-2001 are oligonucleotides which contain G4 or G3 stretches and which may be used for inhibiting replication of herpes simplex virus (HSV), activity of HIV, human cytomegalovirus or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyper-proliferation, malignancy, cardiovascular disease and snake bite. Oligonucleotides such as these, may be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)

RESULT 144 AAQ97981/c

New peptide nucleic acid (PNA) oligomers are provided which (a) consist of naturally occurring nucleobases covalently bound to a polyamide confination of naturally occurring nucleobases covalently bound to a polyamide confination (5' UTR), 3' untranslated region (3' UTR), splice untranslated region (5' UTR), 3' untranslated region (1' UTR), splice junctions or coding sequence of a human immunodeficiency virus gene chosen from env, gag, pol, rev and tat. The PNAs can be used to target conform a single stranded DNA (88DNA) to produce antisense-type gene regulation moieties. They have utility as gene-targetted drugs for modulating HIV processes. Hence they can be used to treat AIDS and other viral infections. They are also useful in diagnostic applications and as research tools. PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which a first CP PNA strand binds with the first PNA strand binds with the first PNA strand. The PNAS possess no significant charge and are water soluble, which facilitates cellular cresulting double helix or with the first PNA strand. The PNAS possess no significant charge and are water soluble, which facilitates cellular to present sequence is a specifically claimed PNA sequence (represented CP PNA the sequence is a specifically claimed PNA sequence (represented CP PNA the sequence of nucleobases) targetting HIV genes. (Updated on 25-MAR-/\*tag= a tat least one (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the nucleobase being attached covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue. Oligomer hybridisable to HIV sequence and contg. peptide nucleic acid sub:unit - binds in complementary manner to DNA and RNA, and useful for modulating HIV viral activity, e.g. in treating AIDS. Peptide nucleic acid, PNA, HIV, human immunodeficiency virus, ALDS, antiviral, antisense; triple helix, ss. The present sequence is a specifically claimed PNA seq by the sequence of nucleobases) targetting HIV genes. 2003 to correct PN field.) Peptide nucleic acid oligomer targetting HIV gene. AAT39966-T39973 represent double stranded coding sequences for minimal motifs of glycine-rich repeat sequences (GRRS). Full length GRRS sequences, such as the Epstein-Barr virus strain B95.8 nuclear antigen invention. The method of the invention is for making an antigenic protein furvisible to the immune system, and consists of inserting a GRRS into the antigenic protein. The method can be used to insert a GRRS into the antigenic protein. The method can be used to insert a GRRS into the therapeutic protein. The therapeutic proteins of viral vectors, or vaccine components. The therapeutic proteins include enzymes, cytokines, lymphokines, cell adhesion molecules, costimulatory molecules, or protein products of drug resistant genes or tumour suppressor genes. The antigenic proteins concerned as gaucher's genetic and viral diseases, especially enzyme disorders such as Gaucher's disease, cancer, immune system disorders and other diseases treatable by

Sequences shown in AAV55812 to AAV55827 represent primers used in the course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to proteinly degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of formula (Glya) X(Glyb) Y(Glyc) Zl where Glya, Glyb, Glyc are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune disease, cancer and inflammation. In particular, the core protein may be an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can active in core protein may be an example of the inflammatory and an example of the inflammatory and active in the core protein may be an introreductase protein which can active in carrier of the core protein may be an example of the inflammatory and active in the core protein may be an example of the core protein may be an e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzyme/prodrug therapy to treat cancer or other pathological conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fusion protein; stabilising polypeptide; proteolytic degradation; repistance; half-life; autoimmune disease; inflammation; nitro drug; lkAppaB regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; produug therapy; profease; cancer; pathological condition; minimal motif; PCR primer; ss.

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNPR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TMFRI), where the antisense compound inhibities expression of TMFRI. The antisense compound is useful for inhibiting the expression of treating an animal (preferably human) having a disease or condition associated with TMFRI, ed invention as in the TMFRI, or a liver disease (such as hepatitis, or injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TMFRI. The antisense compound is useful for disquenties, therapeutics, prophylaxis and as research reagents and kits. This polynucleotide sequence represents a human oligonucleotide relating to the TMFRI of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mouse; primer; antilipaemic; cardiant; hypotensive; anorectic; HYPLIF1; FCHL1; lipid disorder; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; cancer; hyperapobetalipoproteinaemia; hypertriglyceridaemia; obesity; ss; familial dyslipidaemic hypertension; syndrome X; insulin resistance; hypercholestexolaemia; chromosome 3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel chemically modified oligonucleotide having no more than about 27 nucleic acid base units. The oligonucleotide modulates mammalian telomere length. The chemically modified oligonucleotide of the invention may be useful for modulating the telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian chromosome, inhibiting the division of a mammalian cell or modulating the effects of aging of a mammalian cell. The oligonucleotides may also useful for treating diseases associated with abnormal telomere length such as aging and hyperproliferative conditions including cancer. The current sequence is that of the G4 phosphorothioate oligonucleotide 2 of the invention which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New chemically modified oligonucleotides, useful for modulating telomere length of a mammalian chromosome, inhibiting the division of a malignant mammalian cell, or modulating the effects of aging of a mammalian cell.
                                                                                                                                                                                                                                                                                                     G4 phosphorothioate oligonucleotide 2 used to modulate telomere length.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to a method of identifying test compounds, which inhibit or downregulate protein tyrosine phosphatase 1B (FTP1B) expression in the liver of at of a non-human mammal. This comprises measuring the downregulation of the p85alpha regulatory subunit of the p65alpha regulatory subunit of the p50alpha and/or p55alpha isoforms of P13-K), and the upregulation of the method is useful for identifying inhibitors or downregulation of the method is useful for identifying inhibitors or downregulators of PTP1B expression in the liver or fat of a non-human mammal, compounds that increase insulin sensitivity and reduce blood glucose in an insulin resistant non-human mammal, or compounds that downregulate the level of expression of at least one gene involved in lipogenesis or gluconegenesis. These compounds are useful for treating type 2 diabetes. The present sequence is a probe for the murine Spot14 coding sequence used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; mouse; HYPLIP1; FCHLI; familial combined hyperlipidaemia; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to the cDNA and protein sequences of novel proteins HYPLIP1 or FCHL1 and to sequence variations within these genes that have been shown to be associated with lipid disorders.

Coligonucleotide probes that hybridise to the cDNA sequence are useful for analysing the expression of FCHL1 by detecting the expression of the mRNA transcript in the sample. A host cell transformed with the cDNA of the invention is useful for producing the protein by recombinant means.

Consecut for treating or preventing a lipid disorder associated with expression of FCHL1 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype.

Consecut for FCHL1 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype.

Consecut for FCHL1 such as familial combined hyperlipidaemia, coronary artery disease, atherogenic lipoprotein phenotype.

Consecut for FCHL1 such as familial combined hyperlipidaemia, familial complemental dyslipidaemic hypertension, syndrome X, obesity, insulin resistance and hypercholesterolaemia. The cDNA sequence is useful in the diagnosis or prognosis of predisposition to lipid disorders and cancers, and also to identify a molecule which enhances or decreases the HYPLIPI or FCHL1 activity. The present sequence represents an oligonucleotide primer specific for the mouse HYPLIPI locus of the invention. The mouse HYPLIPI

                                                                             The invention relates to an isolated polynucleotide comprising a sequence variation of a mouse HYPLIP1 CDNA or a human FCHL1 (familial combined hyperlipidaemia) gene. The FCHL1 polynucleotide, the FCHL1 polypeptide or antibody immunoreactive to the FCHL1 polypeptide are useful for treating or preventing cancer associated with expression of FCHL1, as well as for treating lipid disorder. The mouse HYPLIP1 cDNA or human FCHL1 gene are also useful for diagnosing or prognosing a predisposition to lipid disorder and cancer. ABK70902-ABK71303 represent mouse HYPLIP1, human
                 New mouse HYPLIP1 and human FCHL1 (familial combined hyperlipidemia) genes and their sequence variations, useful for diagnosing, treating or preventing lipid disorders and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                           Mouse; PCR; primer; ss; HYPLIP1; FCHL1; variation; lipid disorder; allele, anti-lipid disorder; anti-cancer therapy; gene therapy; familial combined hyperlipidaemia; coronary artery disease; atherogenic lipoprotein phenotype; hyperapobetalipoproteinaemia; hyperarigilyceridaemia; low density lipoprotein subclass B; LDL; familial dyslipidemic hypertension; syndrome X; hypercholesterolaemia; obesity; insulin resistance; cancer; cytostatic; antilipaemic;

The invertion discloses isolated polymucieclides complishing mouse hirling contention discloses isolated polymucieculdes complishing amount of familial combined hyperlipidaemia 1 (FCHLI) gene, where a variation in isolated polypeptide comprising a variant form of the mouse HYPLPIP amino cid sequence, or a variant form of a fully defined human FCHLI amino acid sequence, or a variant form of a fully defined human FCHLI amino card sequence, where the variant is associated with the lipid disorder, an isolated polymucleotide, where the 12 contiguous nucleotides of the variation position, an isolated polypeptide comprising a contiguous cardis span the variation position, a kit for the detection of the FCHLI amino acids span the variation position, a kit for the detection of the FCHLI cours comprising, an isolated antibody, identifying susceptibility to a clipid disorder which comprises comparing the nucleotide sequence of the difference between the suspected allele and the wild-type sequence contrising an altered HYPLIPI or FCHLI nucleotide sequence of the difference between the suspected allele and a method for screening carding for inhibition or restoration of FCHLI nucleotide sequence and a nation of a pharmaceutical composition. Also disclosed is a transgenic animal which carries an altered HYPLIPIP or FCHLI allele and a method for screening carding for inhibition or restoration of FCHLI gene function as an anticording second discorder or anti-carcer therapy. The polynucleotides, polypeptides and antibodies are useful for treating or preventing (e.g. gene therapy) and altipid disorder associated with expression of FCHLI, for diagnosis or prognosis of predisposition to lipid disorder, and cancer and for treating a lipid disorder such as familial combined hyperlipidaemia, byperraphobetalipoproceinaemia, hyperriglycerideamia, low density company artery disease, atheragenic lipoprotein density hyperspecial company artery disease, atheragenic lipoprotein density in a density or prognosis of predisposition to hyperides
Novel isolated polynucleotide comprising a mouse or human familial combined hyperlipidemia 1 gene having a variation that is associated with a lipid disorder, useful for identifying susceptibility to the lipid

```
The invention describes an isolated polypeptide (I) comprising a variant form of a mouse HYELIPI polypeptide sequence (G1) or a human FCHIL polypeptide sequence (G1) or a human FCHIL polypeptide sequence (G1) or a maino acid sequence the polypeptide sequence (G2), not given in the specification, where the variant form is associated with cancer, or an amino acid sequence having at least 65 % sequence identify to (G1) or (S2). A composition comprising DNA encoding (I) is useful for treating or preventing cancer associated with expression of FCHI. FCHI. gene or HYPLIPI gene and its product are useful for the study of metabolic pathway and cellular mechanism to identify other genes, receptors and relationships that contribute to lipid disorder and cancer. FCHII gene or its fragments are useful in gene the treatment of lipid disorder or cancerous calls. The sequence variation of FCHIL gene or HYPLIPI gene is also useful in the diagnosis and prognosis of predisposition to lipid disorder and cancer. Antisense polymucleotide sequences are useful in preventing or diminishing the expression of HYPLIPI cr FCHIL locus. This sequence represents a primer used in the analysis of the mouse HYPLIPI gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

acid molecule encoding tumor
                                                                                                  Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.
                                                                                                                                                                                      The invention relates to an antisense compound 8 to 30 nucleotides in receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for irreating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a human oligonucleotide relating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid segments of the human genome, particularly from genes including polymorphic sites, for phenotype correlation, forensics,
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

determining the base occupying any one of the polymorphic sites given in the SNP containing sequences. The nucleotide sequences can be used in the diagnosis or monitoring of diseases, such as cancer, inflammation, heart diseases, diseases of the cardiovascular system, and inflammation, heart diseases, diseases of the cardiovascular system, and infection by microorganisms. The oligonucleotides are also useful in the manufacture of a medicament for the treatment or prophylaxis of the diseases, and as a pharmacceutical. SNP containing oligonucleotides are useful in educations such as phenotype correlation, forensics, paternity testing, medicine and genetic analysis DNA sequences AAH62100 - AAH62688 represent segments of human genes which contain single nucleotide polymorphisms (SNPs). A method is included in the invention for analysing a nucleic acid sample, which consists of

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer. Example 18; Page 56; 121pp; English. The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNFR1), where the antisense compound inhibits expression of TNFR1. The antisense compound is useful for inhibiting the expression of TNFR1 in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNFR1, e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNFR1. The antisense compound is useful for

diagnostics, therapeutics, prophylaxis and as research reagents and kits. This polymuclectide sequence represents a human oligonuclectide relating to the INFR1 of the invention 82888

Novel antisense compound targeted to nucleic acid molecule encoding tumor necrosis factor receptor 1 (TNFR1), useful for treating humans having disease associated with TNFR1 e.g. hepatitis, liver injury, liver cancer.

Example 21; Page 61; 121pp; English.

The invention relates to an antisense compound 8 to 30 nucleotides in length targeted to nucleic acid molecule encoding tumour necrosis factor receptor 1 (TNRRI), where the antisense compound inhibities expression of TNRRI. The antisense compound is useful for inhibiting the expression of TNRRI in cells or tissues. The antisense compound is also useful for treating an animal (preferably human) having a disease or condition associated with TNRRI. e.g. a liver disease (such as hepatitis, or liver injury) or a hyperproliferative disorder such as cancer, by inhibiting the expression of TNRRI. The antisense compound is useful for disquestics, therapeutics, prophylaxis and as research reagents and kits. This polymucleotide sequence represents a mouse oligonucleotide relating to the TNRRI of the invention

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonuclectide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallargic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a come in antisense gene therapy. The composition may have a composition at prophylactic or therapeutic respiratory effect of an attiinflammatory steroid in a subject, for reducing or deptenting levels of or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition, love: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or antiinflammatory steroid, ubiquinone, antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive, cytostatic, gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; Gaps Aguilar D; ö Simultaneous detection; multiple target nucleic acid molecule; 0.7%; Score 15.8; DB 1; Length 20; 89.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Zea mays genome in order to detect polymorphic markers. Such markers can be used in the construction of allele-specific primers and probes for amplification or hybridiaation, e.g. to determine common or disparate ancestral petween 2 or morre plants, to monitor the genetic contribution of an ancestral plant, to trace the progeny of proprietary plants, in certification of a hybrid plant or to identify the progeny of a back-crossed plant with an ancestral plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, BCMP 101 protein; breast cancer; medicine; vaccine; prophylaxis; gene therapy; antisense therapy; kidney cancer; cytostatic; PCR; primer;

The present invention relates to novel human BCMP101 proteins and their corresponding polynucleotides. BCMP 101 sequences are useful to screen for agents that interact with BCMP101 and for screening for and/or the diagnosis of breast cancer or monitoring and/or assessing breast cancer treatment in a subject. They are also useful in medicine and in the preparation of medicaments (e.g. vaccines) for use in prophylaxis and/or treatment of breast cancer. Sequences of the invention are also useful in gene therapy. BCMP 101 sequences are useful in antisense therapy for treating breast cancer and/or kidney cancer. The present sequence is treatment in an applicating PCR primer. This sequence is used in the
                                                                                                                                                                                                                                                         Novel BCMP101 polypeptide and polynucleotide encoding the polypeptide, useful in diagnosis, prophylaxis and treatment of breast cancer and/or kidney cancer, preferably breast cancer.

Quantitative determination of genetically modified DNA in food, useful particularly for detecting Roundup Ready soya, by fluorescence-coupled polymerase chain reaction.

Claim 7; Page 10; 14pp; German.

This invention describes a novel method for the quantitative determination of genetically modified DNA (transgene, (1)) in foods by fluorescence-coupled polymerase chain reaction (PCR) based on extraction

PCR, in a first reaction vessel, using two (I) is determined by PCR, in a first reaction vessel, using two (I)-specific primers (P1, P2) and a (I)-specific fluorescent probe (S1), and the change in fluorescence measured relative to a control. The internal amplification control (C1) is a synthetic gene fragment having two binding sites for P1 and P2 and a binding site for a fluorescently labeled probe (S2) that differs from S1 both in sequence and nature of its fluorescent label. In a second reaction vessel a reference gene (II) in (A) is measured similarly, using a probe (S3) and (II)-specific primers (P3, P4), with the change in a probe (S3) and (II)-specific primers (P3, P4), with the change in fluorescence measured relative to a second control (C2) that has binding sites for P3, P4 and S2. S3 differs in both sequence and label from the ratio of amount of (I) to amount of (II). The method is especially used to detect Roundup Ready soya (RRS) in foods and food products, but may be applied to other transgenes in plants, e.g. the Bt-176 gene in transgenic maize. The method avoids risks of contamination and is highly automatable, reproducible, sensitive and specific. This sequence represents a primer used to detect the NS region from the RRS gene which is used in the method of the invention

Novel methods and primers for genetic analysis of biological material by polymerase chain reaction using specific primer pairs useful in, e.g. Forensic medicine.

Claim 7; Col 5; 10pp; German.

This invention describes a novel method for determining the origin of biological material by PCR using specific primers pairs, which are exclusively complementary to the respective animal or plant DNA. The method and primers are useful in forensic medicine or in purity testing raw materials, end products, cosmetics or pharmaceuticals. The methods

Sequence 22 BP; 3 A; 14 C; 1 G; 4 T; 0 U; 0 Other;

The present invention describes a competitive nucleic acid fragment which corresponding to the endogenous gene moiety of a recombinant gene which is bonded to at least one second competitive nucleic acid molecule corresponding to the endogenous gene moiety of a recombinant gene which is bonded to at least one second competitive nucleic acid molecule corresponding to a gene specific to the recombined gene moiety of the competitive nucleic acid fragment, a first pair of primers for amplifying the gene located on the same nucleic acid. Also described: (1) a competitive nucleic acid molecule of the endogenous gene of the first competitive nucleic acid molecule of the endogenous gene of the gene of such recombinant gene, and a second pair of primers for amplifying the second competitive nucleic acid molecule of the recombined of a gene of the gene of such recombinant gene, and (2) quantifying the gene of competitive nucleic acid fragment or the kit. The nucleic acid fragment or the kit. The nucleic acid fragment or the kit. The nucleic acid fragment or the similar materials e.g. soybean and maize. The present sequence represents a port of the amplification of an RRS (coundup ready soybean) inclair acid fragment, which is used in an example from the present
  for determining if there has been contamination of biological AAX82791-X82812 represent the PCR primers used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Competitive nucleic acid fragments applicable in quantifying recombinant genes by PCR, useful in identifying genetically-modified agricultural products and similar materials e.g. soybean and maize.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Quantitative; determination; genetically-modified agricultural product; soybean; maize; RRS; roundup ready soybean; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl.1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogeneeis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX5752 represent specific examples of nucleic acid molecules from the present invention

```

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or the synthesis, expression and/or stability of Hepatitis C virus (HCV) or and enzymes, anterior acids such as hammerhead ribozymes, DNAzymes, and enzymes, anterior acids such as hammerhead ribozymes. DNAzymes, care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer region of HBV on Anterior and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer region of HBV of genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HTV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV or allozyme, inozyme, i Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus Example 1; Page 139; 387pp; English.

Lee P;

```
AATI6392-T16429 represent amplification primers for the human obesity polypeptide (OBP) gene sequence (see AATI6373). These sequences were used to amplify the OBP gene sequence from the VAC contig containing the human OBP gene, in a series of sequence tagged-site (STS)-specific PCR assays. There were 19 STSs found within the YAC contig human OBP gene sequence. This sequence was used in conjuncture with AATI6399 to amplify the STS wSS2359. OBP has effects on both food intake and energy expenditure. OBP and its analogues are useful for modifying body weight (optionally complimed with known medicaments), for treating diabetes, high blood pressure or high cholesterol. The OBP coding sequence (and sequences complimentary to it) can be used in gene therapy for modifying body weight. The protein can be used for reducing weight for health or complete. The protein can be used for reducing weight for hamils. Antagonists of OBP (including antibodies) are useful for increasing body weight, e.g. for treating weight loss associated with cancer, or for commentary for the presence of OBP. The formation of Ab-OBP complexes in domestic animals. OBP antibodies (Ab) can also be used in diagnostic immunoassays for the presence of OBP. The formation of Ab-OBP complexes enables in vitro evaluation of levels of OBP in a sample, especially to detect diseases associated with elevated or decreased levels, and to monitor treatment of these diseases

Nucleic acids of at least 10 nucleotides which are hybridisable to a noncoding region of an OB nucleic acid have been created. The OB gene plays a critical role in the regulation of body weight and adiposity. The nucleic acids may be used as probes or as primers for PCR. They are useful for evaluating the presence of mutations in the human OB gene or for evaluating the level of expression of OB mRNA. Defects associated with OB gene expression result in obese phenotypes

This invention describes a novel method for modifying body weight of an animal which comprises administering mammalian obesity (OB) polypeptide. The products of the invention have anorectic activity. The OB polypeptide at a dose of 5 mg/g/day in 300 micro litres of PBS was injected intraperitoneally into mice. Control mice were injected with PBS dialysate of the recombinant protein. The body weight of the mice was noted. The results shows that recombinant the OB polypeptide is capable of reducing a body weight and is found to be effective when it is administered daily. The OB polypeptide acts as a part of the signalling pathway by which adipose tissue communicates with the brain and other organs. (I) is useful for modulating weight of an animal especially humans. This sequence represents a POR primer used in the amplification of a human OB protein described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; mouse; anabolic; cytostatic; immunostimulant;

RESULT 170

New obese polypeptide useful for inducing reduction of body weight in an animal, for preparing a composition for treating obesity, disease associated with obesity such as hypertension, heart disease or type II

Example 10; Page 44; 144pp; English.

Antibodies against the mammalian obesity (0B) polypeptide have been identified. The antibodies are useful for modulating the activity of 0B pathological conditions in which there is abnormal depression or altocontion of body weight. The antibodies are used to treat very of os associated with cancer, AIDs and anorexia nervosa. They are useful for the diagnosts of nutritional disorders such as obesity and diseases associated with obesity, such as hypertension, heart disease and Type II the blood or plasma of an individual
                                                                                                                                                                                                                                                               Novel antibody to mammalian obesity polypeptide useful for diagnosis and treatment of weight loss associated with disorders such as cancer, AIDS and anorexia nervosa.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ss; human; obese polypeptide; body weight; PCR; ob polypeptide; leptin; adipocyte; appetite reduction; cosmetic; primer; fat deposit reduction; improved body appearance; heart disease; obesity; agriculture; nutritional disorder; cancer associated weight loss; type II diabetes; obesity associated disease; AIDS associated weight loss; hypertension;

host cell transfected with a vector expressing the polypeptide is useful in the preparation of modulators of the polypeptide and its nucleic acid in the preparation of modulators of the polypeptide and its nucleic acid antimoder. Fragment of the polypeptide is useful for preparing an antibody. The antibody is useful for measuring the presence of the polypeptide in a sample; for evaluating the level of ob polypeptide in a sample; for evaluating the presence of a disease associated with elevated or decreased levels of ob polypeptide in a mammalian subject; for imaging ob polypeptide in situ. A composition comprising the polypeptide is useful for reducing body weight of an animal. Compositions containing the polypeptide and the antagonist of the polypeptide is useful for increasing body weight of an animal. Compositions containing the polypeptide and the antagonist are useful for treating obseity, weight loss associated with cancer or AIDS, disease associated with beseity such as hypertension, heart disease or type II diabetes. The present sequence represents a human sequence tagged
                                                                                                                                                                                                                                                                                                                                                              expressed predominantly by adipocytes and capable of inducing reduction of body weight in an animal. The polypeptide is useful for monitoring therapeutic treatment of adipocytes and capable of inducing reduction of body weight in an animal. The polypeptide is useful for monitoring therapeutic treatment of adisease associated with elevated or decreased redicimmunoassays for measuring fat and/or plasma levels of ob protein or for detecting the presence and level of receptor for ob on tissues, such as hypothalamus, for screening expression libraries to isolate active receptors; for use in cosmetics by improving body appearance by reducing fat deposits or appetite or both and is used independently or in conjugation with other cosmetic strategies e.g. surgery for its cosmetic effect; for identifying agonists or antagonists that affect its activity and has potential agricultural uses e.g. increasing the body weight of animals. Nuclectide, in gene therapy for obseity and in the mutation in ob nucleotide, in gene therapy for obseity and in the contract of its encoded RNA and protein in nutritional disorders.
                                                                                                                                                                                                                                                                                                                                                  polypeptide, also known as leptin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ob; human; obese; adiposity; body weight; anorectic; anabolic; PCR; primer; chromosome 7; STS; sequence tagged site; 7q31.3; microsatellite marker; ss.

The invention describes an OB (obese) polypeptide (also referred as leptin) (1), capable of modulating body weight, comprising amino acids 22—167 of a human or mouse OB polypeptide sequence of 167 amino acids (S1), given in the specification, or amino acids 22—166 a human or mouse OB polypeptide sequence of 166 amino acids (S2), given in the specification. The OB polypeptide is useful for reducing body weight in specification. The OB polypeptide is useful for reducing body weight in results in weight gain (protein therapy), for treating weight loss associated with cancer, acquired immunodeficiency syndrome (AIDS) or anorexia nervosa. This sequence represents a primer associated with the isolation of the human obese (ob) or leptin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin B1. Representative examples of ribozyme recognition sites are given in AAAB2415 to AAAB677. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ribozyme; hairpin; hammerhead; gene therapy; vasotropic; restenosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New hairpin and hammerhead ribozyme for inhibiting restenosis, cleaves RNA encoding a cyclin or cell-cycle dependent kinase other than CDKI, PCNA and Cyclin BI.
                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                   polypeptide, also referred to as leptin capable of modulating body weight, useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a hairpin or hammerhead ribozyme,
                                                                                                                                                                                                                                                                                                                                                                                                                                 .

                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method of modifying the body weight of an animal comprising administering an obese gene (OB) polypeptide analogue, capable of modulating body weight and adiposity. The invention has anorecite and anabolic activity, AB161415-AB161468 represent PCR primers used in the detection of sequence tagged sites (STS's) and microsatellite markers used in the mapping of the human Ob gene onto chromosome 7. These genetic markers represent an important tool for studying the possible role of the Ob gene in inherited forms of human

scarring such as keloid, adhesion and hypertrophic or hypertrophic burn scar. AAH57577 to AAH62099 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequences given in AAQ73325-81 represent oligonucleotides which hybridise specifically with DNA or RNA from a herpes virus gene corresponding to one of the open reading frames ULS, -8, -9, -20, -27, -30, -42, -52 or IE175 of herpes simplex virus type I (HSV-1). These oligos pref. hybridise with a translation initiation site, a coding region or a 5' untranslated region. These oligos may be used in compositions for the treatment and diagnosis of herpes viral infection, by contacting the virus or the animal, or its cells, tissues or body flwids with the oligo. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotide(s) hybridising with DNA or RNA of herpesvirus gene are used in the treatment and diagnosis of herpes simplex virus, cytomegalovirus, Epstein Barr virus and varicella zoster infections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a ribozyme [1] which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule [II] comprising a promoter operably linked to a nucleic acid segment encoding [1]. [1] can have antipsoriatic, anciet acid segment encoding [1]. [1] can have antipsoriatic, christophalmological, cytostatic, antiseborcheic, antidiabetic, antisickling, ophthalmological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cytokine involved in inflammation. [1] can be used in gene therapy. [1] and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squase such as psoriasis, atopic dermatitis, actinic keratosis, also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of prematurity and retinal detachment, and for treating and preventing
                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, ribozyme therapy, hairpin ribozyme, hammerhead ribozyme, recognition site, target, ribozyme binding site, eye disease, vulnerary, proliferative disease, skin disease, sporiasis, diabetic retinopathy, cytokine, inflammation; cell-cycle dependent kinase, cyclin, MMP; matrix metalloproteinase, growth factor, reductase, scarring, cytostatic, antipsoriatic, defaratological, antiseborrheic, antidiabetic, virucide, antisticking, ophthalmological, keratolytic, gene therapy, viral wart; atopic dermatitis, actinic keratosis, squamous cell cardinoma, basal cell cardinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.

```
The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a d4 or two d3 stretches and which may be used for inhibiting replication of herpes simplex virus (ESV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human representation or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified oligo-nucleotide contg guanine quartet - inhibits activity iruses, e.g. HIV, and phospholipase A2 and modulates telomere length

```
/*tag= a house (and preferably all) of the backbone subunits are composed of N-acetyl N-(2-aminoethyl)glycine peptide residues, the nucleobase being attached covalently to the acetyl group and the peptide linkage being formed by condensation of the glycine carboxy group of one residue with the amino group of the 2-aminoethyl moiety in the next residue.
                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAQ61825-50 and AAQ61886-906 are oligonucleotides which contain a d4 or two G3 stretches and which may be used for inhibiting replication of herpes suppex virus (HSV). Oligonucleotides such as these may also be used for inhibiting activity of HIV, human representations or influenza virus, or for treating inflammatory and neurological disorders caused by phospholipase A2 activity in cases of hyperproliferation, malignancy, cardiovascular disease and snake bite. They may also be used for inhibiting division of malignant cells by modualting telomere length, which may also retard aging. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                New modified oligo-nucleotide contg guanine quartet - inhibits activity of viruses, e.g. HIV, and phospholipase A2 and modulates telomere length of chromosomes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
